2. FUNCTIONAL DESCRIPTION

2.1. Wireless Networking

HF-LPT200 module can be configured as both wireless STA and AP base on network type. Logically there are two interfaces in HF-LPT200. One is for STA, and another is for AP. When HF-LPT200 works as AP, other STA equipments are able to connect to HF-LPT200 module directly. Wireless Networking with HF-LPT200 is very flexible.

Notes:

AP: that is the wireless Access Point, the founder of a wireless network and the centre of the network nodes. The wireless router we use at home or in office may be an AP.

STA: short for Station, each terminal connects to a wireless network (such as laptops, PDA and other networking devices) can be called with a STA device.

2.1.1. Basic Wireless Network Based On AP (Infrastructure)

Infrastructure: it's also called basic network. It built by AP and many STAs which join in. The characters of network of this type are that AP is the centre, and all communication between STAs is transmitted through the AP. The figure following shows such type of networking.

Figure 9. HF-LPT200 Basic Wireless Network Structure

2.1.2. Wireless Network Based On AP+STA

HF-LPT200 module support AP+STA network mode, means module support one AP interface and one STA interface at the same time, as following figure,

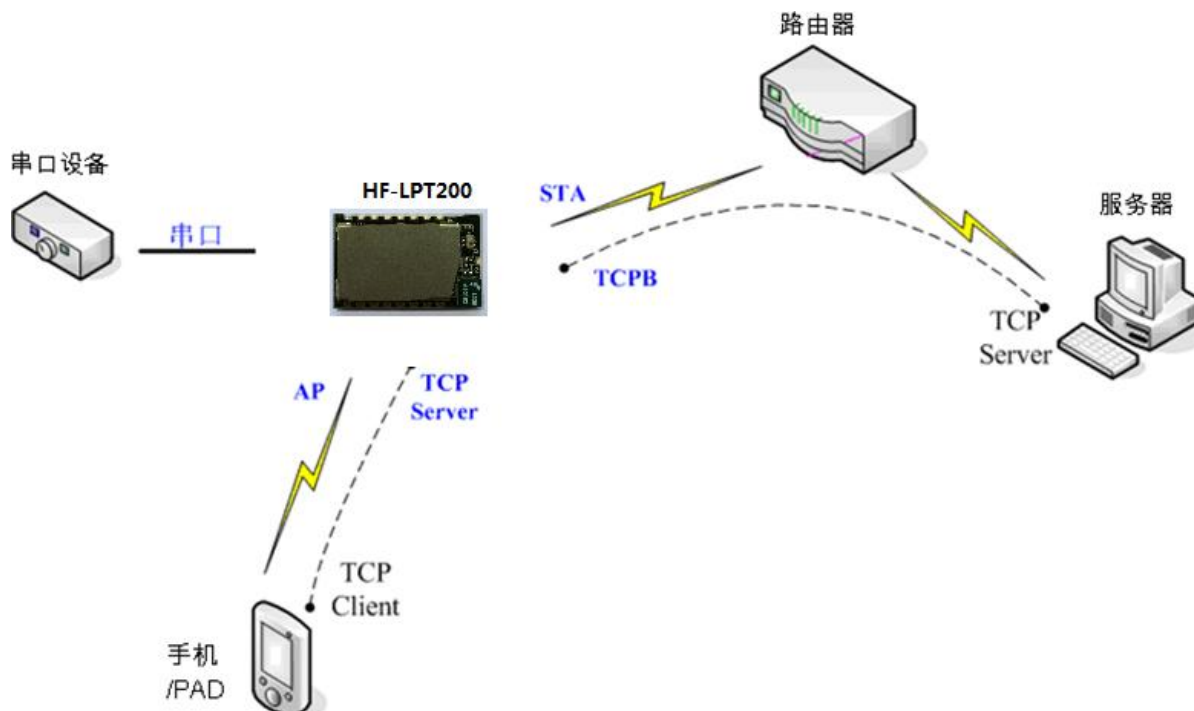

Figure 10. HF-LPT200 AP+STA Network Structure

When module enables AP+STA function, Module's STA interface can connect with router and connect to TCP server in the network. At the same time, module's AP interface is also active and permit phone/PAD to connect through TCPB, then phone/PAD can control user device and and setting the module parameters,

The advantage of AP+STA mode is:

- Users can easily setting and track user device through Phone/PAD and not change the original network setting.
- Users can easily setting module's parameters through WiFi when module works as STA mode.

2.2. Work Mode : Transparent Transmission Mode

HF-LPT200 module support serial interface transparent transmission mode. The benefit of this mode is achieves a plug and play serial data port, and reduces user complexity furthest. In this mode, user should only configure the necessary parameters. After power on, module can automatically connect to the default wireless network and server.

As in this mode, the module's serial port always work in the transparent transmission mode, so users only need to think of it as a virtual serial cable, and send and receive data as using a simple serial. In other words, the serial cable of users' original serial devices is directly replaced with the module; user devices can be easy for wireless data transmission without any changes.

The transparent transmission mode can fully compatible with user's original software platform and reduce the software development effort for integrate wireless data transmission.

The parameters which need to configure include:

- **Wireless Network Parameters**
 - Wireless Network Name (SSID)
 - Security Mode
 - Encryption Key
- **TCP/UDP Linking Parameters**
 - Protocol Type
 - Link Type (Server or Client)
 - Target Port ID Number
 - Target Port IP Address
- **Serial Port Parameters**
 - Baud Rate
 - Data Bit
 - Parity (Check) Bit
 - Stop Bit
 - Hardware Flow Control

2.3. UART Frame Scheme

2.3.1. UART Free-Frame

HF-LPT200 support UART free-frame function. If user select open this function, module will check the intervals between any two bytes when receiving UART data. If this interval time exceeds defined value (50ms default), HF-LPT200 will think it as the end of one frame and transfer this free-frame to WiFi port, or HF-LPT200 will receive UART data until 1000 bytes, then transfer 1000 bytes frame to WiFi port.

HF-LPT200's default interval time is 50ms. User can also set this interval to fast (10ms) through AT command. But user have to consider if user MCU can send UART data with 10ms interval, or the UART data may be divide as fragment.

Through AT command: AT+UARTTE=fash/normal, user can set the interval time: fast (10ms) and normal (50ms).

2.3.2. UART Auto-Frame

HF-LPT200 support UART auto-frame function. If user select open this function and setting auto-frame trigger length and auto-frame trigger time parameters, then module will auto framing the data which received from UART port and transmitting to the network as pre-defined data structure.

- **Auto-frame trigger length:** The fixed data length that module used to transmitting to the network.
- **Auto-frame trigger time:** After the trigger time, if UART port received data can't reach auto-frame trigger length, then module will transmitting available data to the network and bypass the auto-frame trigger length condition.

Detailed UART auto-frame function can refer to AT+instruction set “UARTF/UARTFT/UARTFL” introduction.

2.4. Encryption

Encryption is a method of scrambling a message that makes it unreadable to unwanted parties, adding a degree of secure communications. There are different protocols for providing encryption, and the HF-LPT200 module supports following:

- ◆ WEP
- ◆ WPA-PSK/TKIP
- ◆ WPA-PSK/AES
- ◆ WPA2-PSK/TKIP
- ◆ WPA2-PSK/AES

2.5. Parameters Configuration

HF-LPT200 module supports two methods to configuration parameters: **Web Accessing** and **AT+instruction set**.

Web accessing means users can configure parameters through Web browser. When HF-LPT200 module connected to wireless network, parameters configuration is done on a PC connected to the same wireless network.

AT+instruction set configuration means user configure parameters through serial interface command. Refer to “AT+instruction set” chapter for more detail.

2.6. Firmware Update

HF-LPT200 module supports two on-line upgrade methods:

- Webpage Wi-Fi Upgrade
- Remote Upgrade

Webpage based Wi-Fi upgrade, please refer to 3.1.8 firmware upgrade page, user can upload firmware file from PC to HF-LPT200.

HF-LPT200 module also support upgrade from remote HTTP server, keep module connects to AP router before execute remote HTTP upgrade. Remote upgrade have two methods: **Direct Download and Upgrade**, **Configure File Based Upgrade**.

◆ Configure File Based Upgrade

AT+UPURL command to set the remote directory which the configuration file located, such as AT+UPURL=http://www.hi-flying.com/admin/down/

Notes: The last '/' can't be remove

AT+UPFILE command to set the configuration file name, such as AT+UPFILE=config.txt

AT+UPST command to start remote Application upgrade. After execute this command, the module will firstly download configuration file (“config.txt”), then download the upgrade file base on the URL address listed in the configure file.

General “config.txt” file format as following example:

[URL]=<http://10.10.100.100:80/lpb.bin>

[URL]= the URL address of Application.

◆ **Direct Download and Upgrade**

AT+UPURL command to set the remote directory and file name, such as:

AT+UPURL=<http://www.hi-flying.com/admin/down/lpb.bin>

After execute this command, the module will directly download the “lpb.bin” file from remote directory and start upgrade Application.

Notes: please contact with high-flying technical people before upgrade firmware, or maybe damage the module and can't work again.

2.7. SOCKET B Function

HF-LPT200 support double socket communication.

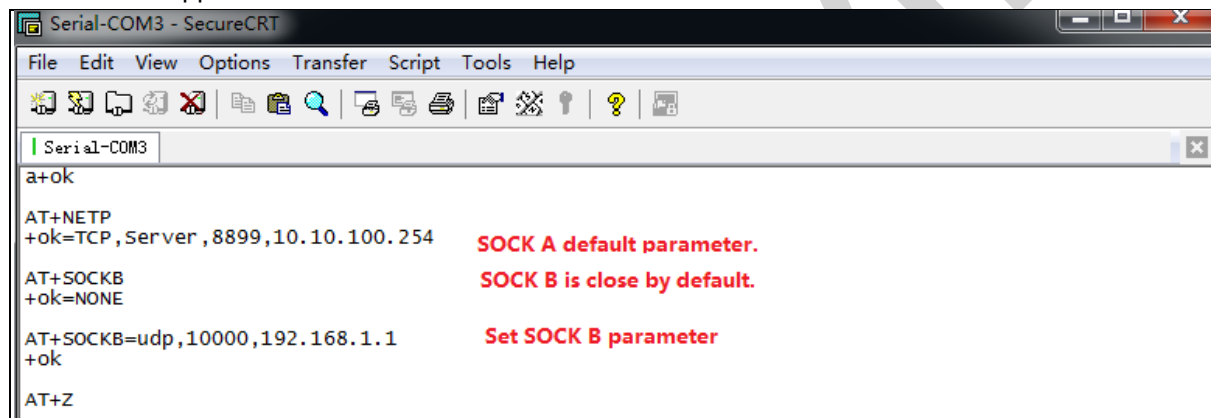

Figure 11. Socket B function demo

2.8. Multi-TCP Link Connection

When HF-LPT200 module configured as TCP Server, it supports Multi-TCP link connection, and maximum 5 TCP clients permitted to connect to HF-LPT200 module. User can realize multi-TCP link connection at each work mode.

Multi-TCP link connection will work as following structure:

Upstream: All dates from different TCP connection or client will be transmitted to the serial port as a sequence.

Downstream: All data from serial port (user) will be replicate and broadcast to every TCP connection or client.

Detailed multi-TCP link data transmission structure as following figure:

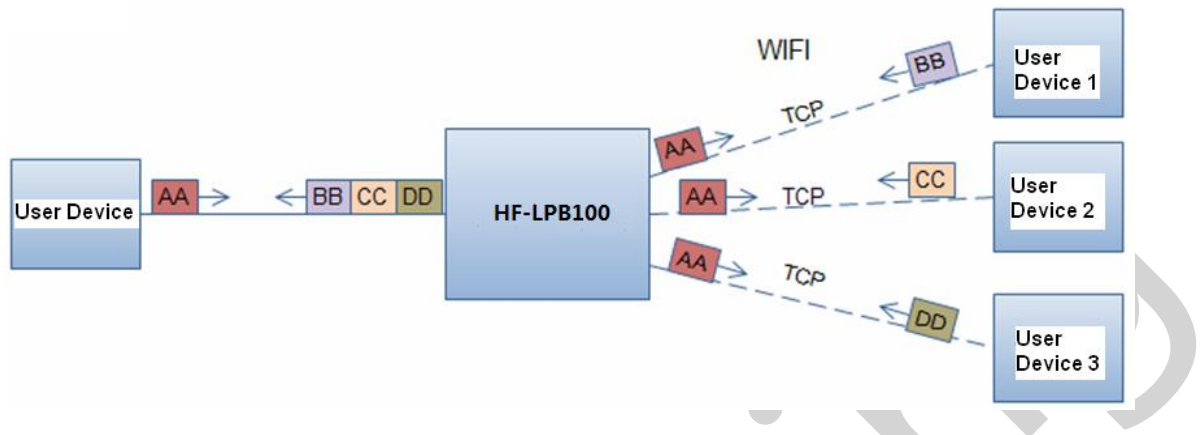

Figure 12. Multi-TCP Link Data Transmission Structure

3.2. HF-LPT200 Usage Introduction

3.2.1. Software Debug Tools

High-Flying use two common software tools debugging and applying HF-LPT200 module. (User can also select other tools used to debug serial port).

- Serial Debugging Software: ComTools **ComTools.exe**
- Ethernet Debugging Software: TCPUDPDbg **TCPUDPDbg.exe**

3.2.2. Network Connection

User can select two methods to connect HF-LPT200 module base on dedicated application.

- **Use HF-LPT200 STA interface.** HF-LPT200 and debug PC2 connect to a wireless AP, another PC1 (or user device) connect to HF-LPT200 module with serial port:

Figure 15. STA Interface Debug Connection

- **Use HF-LPT200 AP interface.** Debug PC2 connect to HF-LPT200 through wireless

- connection, another PC1 (or user device) connect to HF-LPT200 module with serial port.

Figure 16. AP Interface Debug Connection

3.2.3. Default Parameter Setting

- Default SSID: HF-LPB100;
- Deault security mode: open,none;
- User UART parameter setting:115200,8,1,None;
- Default network parameter setting:TCP,Server,8899,10.10.100.254;
- Module IP address: dhcp,0.0.0.0,0.0.0.0,0.0.0.0;

3.2.4. Module Debug

PC1 open “CommTools” program, setting the same serial port parameters with HF-LPT200 module and open serial port connection.

Figure 17. “CommTools” Serial Debug Tools

PC2 open “TCPUDPDbg” program, and create a new connection. If HF-LPT200 configured as Server mode, “TCPUDPDbg” Tools shall create “Client” mode connection. Or otherwise, create a “Server” mode connection.

Figure 18. “TCPUDPDbg” Tools Create Connection

Then setting the TCP/UDP connection parameters. Default as following:

Figure 19. "TCPUDPDbg" Tools Setting

Then, click "Create" button to create a connection.

Figure 20. "TCPUDPDbg" Tools Connection

Now, in transparent transmission mode, data can be transferred from "CommTools" program to "TCPUDPDbg" program, or in reverse. You can see data in receiver side will keep same as in sender side.

3.3. Typical Application Examples

3.3.1. Wireless Control Application

Figure 21. Wireless Control Application

For this wireless control application, HF-LPT200 works as AP mode. Module’s serial port connects to user device. So, control agent (Smart phone for this example) can manage and control the user device through the wireless connection with HF-LPT200 module.

3.3.2. Remote Management Application

Figure 22. Remote Management Application

For this remote management application, HF-LPT200 works as STA mode and connects to Internet through wireless AP. Module configured as TCP Client and communicates with remote TCP server at Internet. Module’s serial port connects to user device.

So, user device’s data or sampling information can send to remote TCP server for storage or processing. Also remote TCP server can send command to control and manage the user device through the wireless network.

3.3.3. Transparent Serial Port Application

For this transparent serial port application, two HF-LPB100 modules connect as below figures to build up a transparent serial port connection. One HF-LPB100 works as AP mode, another HF-LPB100 works as STA mode. Make the STA device connects to AP.

4. AT+INSTRUCTION INTRODUCTION

4.1. Configuration Mode

When HF-LPT200 power up, it will default works as transparent transmission mode, then user can switch to configuration mode by serial port command. HF-LPT200 UART default parameters setting as below figure,

Figure 24. HF-LPT200 Default UART Port Parameters

In configuration mode, user can setting the module through AT+instruction set, which cover all web page setting function.

4.1.1. Switch to Configuration Mode

Two steps to finish switching from transparent transmission mode to configuration mode.

- **UART input “+++”, after module receive “+++”, and feedback “a” as confirmation.**
- **UART input “a”, after module receive “a” and feedback “+ok” to go into AT+instruction set configuration mode.**

Figure 25. Switch to Configuration Mode

Notes:

1. When user input “+++” (No “Enter” key required), the UART port will display feedback information “a”, and not display input information “+++” as above UART display.

2. Any other input or wrong step to UART port will cause the module still works as original mode (transparent transmission).
3. “+++” and “a” should be input in a certain period of time to make the module switch to configuration mode. Like the following sequence.

- ◆ Query Operation

AT+HTTPCN<CR>

+ok=<Connection><CR><LF><CR><LF>

- ◆ Set Operation

AT+HTTPCN=<Connection><CR>

+ok<CR><LF><CR><LF>

- Parameters:

- ◆ Connection: Max length is 20 bytes.

B.1.5. AT+HTTPUA

- Function: Set/Query User-Agent of HTTP protocol header.

- Format:

- ◆ Query Operation

AT+HTTPUA<CR>

+ok=<Parameter><CR><LF><CR><LF>

- ◆ Set Operation

AT+HTTPUA=<Parameter><CR>

+ok<CR><LF><CR><LF>

- Parameters:

- ◆ Parameter: Max length is 20 bytes.

B.1.6. AT+HTTPDPT

- Function: Send HTTP request or data.

- Format:

- ◆ Set Operation

AT+HTTPDPT=<Data><CR>

+ok<CR><LF><CR><LF>

- Parameters:

- ◆ Data: HTTP request data, send AT+HTTPDPT directly if no data to be sent.

B.2. HTTP Example

HTTP parameter settings are as follows:

AT+HTTPURL=192.168.1.1,80	Set HTTP server address and port
AT+HTTPPTP=POST	Set HTTP request type
AT+HTTPPH=/abcd	Set HTTP protocol header path
AT+HTTPCN= keep-alive	Set HTTP Connection area
AT+HTTPUA= lwip1.3.2	Set HTTP User-Agent area

If send “AT+HTTPD”, the data packet will be sent as the following instance including the two new line:

```
POST /abcd HTTP/1.1
Connection:keep-alive
User-Agent:lwip1.3.2
Content-Length:0
Host:192.168.0.127:8999
```

If send AT+HTTPD=abcd, the data packet will be sent as the following instance:

```
POST /abcd HTTP/1.1
Connection:keep-alive
User-Agent:lwip1.3.2
Content-Length:4
Host:192.168.0.127:8999
```

abcd

The data received from HTTP server will be output to serial port and end with “+ok”.

If the module hasn't received data from HTTP server for 5 second, it will cut the TCP link with HTTP server.

C.3. Sending HTTP Raw Data in Throughput Mode(Recommend)

Step 1、 Configure HTTP server information

```
AT+NETP=tcp,client,80,testnewjava.gotoip4.com
+ok
```

Step 2、 Configure module connecting to router AP and reboot.

```
AT+WSSSID=Tenda_GYH
+ok
AT+WSKEY=wpa2psk,aes,12345678
+ok
AT+WMODE=sta
+ok
AT+Z
```

Step 3、 Sending HTTP raw data via UART, end the data with<CR><LF><CR><LF>

C.4. Sending HTTP Request By AT Command

Step 1. Configure HTTP AT command. SOCKB must set as None.

```

AT+HTTTPURL
+ok=testnewjava.gotoip4.com,80

AT+HTTTPTP
+ok=GET

AT+HTTTPPH
+ok=/bbb.html

AT+HTTTPCN
+ok=Keep-Alive

AT+HTTTPUA
+ok=lwip1.3.2

AT+SOCKB
+ok=NONE
    
```

Step 2. Configure module connecting to router AP and reboot.

```
AT+WSSSID=Tenda_GYH
+ok

AT+WSKEY=wpa2psk,aes,12345678
+ok

AT+WMODE=sta
+ok

AT+Z
```

Step 3. Send HTTP request

```
AT+HTTPDPT
HTTP/1.1 200 OK
Server: nginx
